

eToro Active Trading Meeting Pack

Sondre Flateraaker | eToro profile Flaten | 8 October 2026

We propose a small, cash-funded overnight stock book. Each morning we combine the previous completed US session's options flow, Hidden Angles and research with technical analysis. We review up to three stocks for entry near the US close and sell strategy-owned positions at the following regular opening.

Current position: The daily design is selected. A runnable paper evaluation repository is available, with recorded tests for a weekly selection version. The daily selection and technical-analysis integration still require separate validation before live operation.

Meeting schedule

Session	Date	Duration
1	Thursday 8 October 2026	90 minutes
2	Thursday 15 October 2026	90 minutes
3	Thursday 22 October 2026	90 minutes
4	Thursday 29 October 2026	90 minutes

Open the [ProInvestor Hub](#) and select **Active Trading Track** for calendar invitations, session start times, joining links, speakers, full agenda and session-specific preparation. Confirm the invitation timezone before adding it to your calendar.

What the programme covers

- Structured research and evaluation of a systematic investment book.
- Risk review and operation within defined agent autonomy limits.
- Reporting standards suitable for continuing oversight.
- An agent-supported operating setup built around the intended live strategy.

The four requested preparation items

- **Strategy:** Daily research, up to three underlying-share positions and a next-opening exit.
- **Evaluation repository:** Runnable paper system and reproducible checks; daily variant validation remains to be completed.
- **Working agent:** Coding/research workspace available; broker scheduling and execution permissions require verification.
- **Book size and risk:** Proposed \$5,000 allocation, 10% per stock, 30% total exposure; account risk target 3-4, pause/review new entries at 5 or above.

The daily stock strategy

Research question: Can a verified company thesis, supported by observable options activity and sensible price conditions, produce positive overnight returns after achievable trading costs? This is a hypothesis to test, not a claim of an established edge.

Trading scope

- Buy long underlying US shares or verified US-listed ADRs, cash-funded at X1.
- Options flow is research evidence. We do not buy the options described in the file.
- No shorts, leverage, CFDs or ETF trades in the main version. Leave unused allocation in cash.
- Create a fresh shortlist each eligible morning. Freeze it at 08:15 Europe/Paris; late information may remove names, but must not create a backdated selection.

Combine the three inputs

- **Options flow:** Use the latest completed-session stock records, classify ask-side calls and puts, and calculate the qualifying premium totals.
- **Hidden Angles:** Identify the company mechanism, expected timeframe, latest supporting claim and strongest contrary evidence. Verify key claims against original issuer, regulatory or other authoritative sources.
- **Research:** Check earnings, guidance, corporate events, sector drivers and the reason the thesis matters during this specific overnight window.
- **Technical analysis:** Review trend, price location, volatility, support and resistance. Explain supportive, mixed or opposed conditions without inventing a win probability.

Starting options flow screen

- At least \$100,000 premium per qualifying row; unambiguous documented ask-side activity.
- Two to ten calendar days to expiry at that day's selection. Supporting contracts must remain relevant through the planned exit.
- Net inferred bullish premium of at least \$1 million and bullish share of at least 70% within the qualifying sample.
- Report concentration in one print, expiry or strike, other-DTE contrary puts and possible hedging. Ask-side calls are an inference, not proof of opening ownership.

The research output

- Return up to ten candidates and highlight up to three for execution review. A shortlist does not authorize an order.
- For each name: source rows and dates, flow arithmetic, verified thesis, contrary evidence, event timing, technical verdict, invalidation condition and reasons to skip.
- Do not force three positions, add a familiar company to fill a slot or carry yesterday's winner forward without today's review.

Daily timing and technical review

Use the actual US exchange calendar in America/New_York and display local times in Europe/Paris. Regular US trading is 09:30-16:00 New York time. The schedule below is separate from the workshop meeting schedule. [1]

Step	Rule	Usual Paris time
File delivery	Previous completed-session information; log actual receipt	Around 07:00
Upload and freeze	Upload 08:00; freeze research universe 08:15	08:00 / 08:15
Final review	Regular close minus 30 minutes	21:30
Entry target	Regular close minus 5 minutes	21:55
Submission cutoff	No new entries after close minus 1 minute	21:59
Exit	Next regular US opening at 09:30 New York	Next day 15:30

- **Entry days:** Tuesday, Wednesday and Thursday. Exit Wednesday, Thursday and Friday. No Monday or Friday entry in the initial version.
- Skip an entry if the next regular session crosses a full market holiday or weekend. An unexpected halt or closure may still delay an exit.
- During 26-30 October 2026, Paris has changed clocks and New York has not: review 20:30, entry 20:55, cutoff 20:59 and next open 14:30. This includes the week of the fourth workshop; confirm its invitation timezone separately.
- Adjust to early closes. If the runtime cannot enforce the correct session window, skip the entry. A target time is not a guaranteed auction price or fill.

Technical analysis before entry

- Use at least 60 completed, split-consistent regular-session daily bars; prefer 120. Calculate SMA20 and SMA50, RSI14, ATR14 and volatility relative to price.
- Review prior-session high, low and close, recent range, support/resistance and late-session price direction.
- Use intraday VWAP and volume only when the underlying share-volume data are reliable. Broker tick volume is not automatically exchange-traded volume.
- TA is required analysis. Mechanical SMA and volume gates remain disabled until a separately evaluated rule is adopted.

Official closing and opening prices are comparison benchmarks. Paper or actual entry and exit records must identify their own timestamp and fill price; do not report an official print as a trade that occurred.

Capital risk and entry limits

We propose a **\$5,000** practical pilot allocation, not a proven economic minimum. Smaller broker-permitted orders can test connectivity. More capital does not remove percentage trading costs.

Pilot setting	Proposed limit
Per stock	10% of strategy capital; \$500 on a \$5,000 allocation
Positions	Zero to three simultaneous positions
Total gross exposure	30%; \$1,500 maximum, including pending orders
Unused capital	Cash; no replacement trade merely to fill a slot
Account risk target	3-4; pause and review new entries at 5 or above

Checks required for every new entry

- Candidate is on today's frozen list; supporting evidence is valid; no unresolved contrary news or material scheduled company event in the holding window.
- Verify exact account, instrument, underlying-share settlement, X1 eligibility, minimum size and permitted fractional units.
- Broker quote is non-delayed and no more than 60 seconds old. Bid/ask spread is at most 20 basis points, or 0.20%.
- Entry ask is within +/-2% of this week's defined official Monday close; reference age at most four calendar days. Missing or holiday Monday references are not silently replaced.
- Account risk, funds, fees and pending exposure are known. An unresolved previous order or exit blocks new buys.

Portfolio ownership and loss policy

- Close only the exact position identifiers created and owned by this strategy. Existing PLTR, RCLB and all other holdings remain outside its sell process.
- The displayed broker risk score describes the account. Position limits do not guarantee a particular score or eliminate correlated sector exposure.
- A 10% loss on one \$500 holding is \$50, or 1% of this book; on three such holdings it is \$150, or 3%. These are scenarios, not loss caps.
- Agree dollar loss limits, drawdown rules, restart responsibility and any stop/target policy before live operation. No averaging down or extension of the planned holding period.

Costs to confirm

Confirm programme coverage, opening/closing fees, spread, slippage, FX and operating costs. A 7 October \$500 Micron underlying-share opening preview showed zero transaction fee and \$0.07 modeled spread for that request only, not a verified round trip. Actual ask/bid fills already include spread; do not subtract it twice. [2]

Runnable evaluation and agent readiness

The existing repository supplies a working paper implementation with source ingestion, structured research decisions, calendar scheduling, a persistent position ledger, reconciliation and performance accounting. Its currently tested shortlist is fixed for the week.

What has been verified

- Recorded 7 October validation: 100 tests passed, plus six independent adversarial checks. Coverage includes stale data, calendar changes, caps, partial/unknown fills, restart recovery and protected holdings.
- A historical price-based comparison rebuilt 21 numerical output files and its gated summary. The proprietary-flow and original PDF production steps were excluded from that rebuild.
- Synthetic demonstrations and a fresh-extraction check completed. Synthetic prices and outcomes prove operational behavior, not trading profitability.
- An actual-file missing-data rehearsal kept \$5,000 modeled cash with zero orders or fills, because mandatory research and market inputs were incomplete.

What still needs implementation and testing

- **Daily version:** Replace the weekly selection interface with independently dated daily freezes and add the current TA calculations and research handoff. Keep daily and weekly performance records separate.
- **Live inputs:** Verify complete file parsing and a continuously refreshed, authenticated stock-price and account-data feed. The present scheduler consumes supplied snapshots; it does not fetch live quotes itself.
- **Execution:** Validate the actual broker connection, approved capital, opening and exact-position closing, partial fills, cancellation and transaction approval requirements. Broker writes are disabled in the paper repository.
- **Operations:** Verify persistent scheduling through both entry and exit, a single executor, restart reconciliation, halt controls and delivery of alerts to the nominated owner.

Demonstration to bring to the meeting

Use the existing **evaluation_repository** folder inside the submission package. In its README, follow the Python 3.12 and pinned-dependency installation steps. The following two commands run the documented demonstration and checks:

```
python -m weekly_strategy.cli demo
python scripts/validate.py
```

The weekly command name reflects the implementation being demonstrated. It does not validate the selected daily design. Bring the README, validation results, raw-file audit and paper ledgers for review.

Working agent requirement

A coding/research agent workspace is available, and the separate bot instructions have been downloaded. Demonstrate that the chosen environment reads the files and produces a structured decision. Verify that the programme accepts this setup as the equivalent of Claude Code. A prompt or connected read-only tool alone is not an unattended trading service.

Research evidence and simulation findings

What the current data can establish

- The inspected flow export contains 48,035 retained records. Every derived contract expiry is after 6 October 2026, consistent with removal of expired contracts.
- This prevents a complete historical short-DTE reconstruction. A missing expired trade is unavailable data, not zero flow; a later export cannot prove earlier availability.
- There is no validated overnight profit probability, best entry minute or profitable daily flow-plus-Hidden-Angles backtest. Archive complete dated inputs prospectively.

Historical comparison and cost sensitivity

The earlier gated price-only comparison returned **-35.91% in 2025 at 20 basis points per side**, or 40 per round trip. Positive hypothetical 6- and 9-basis-point round-trip cases were not observed eToro fills and do not validate the daily strategy.

ETF review and workflow fit

- **Decision:** Keep underlying stocks as the main strategy. Use ETF/index flow for context and a separately labeled paper comparison.
- An ETF roster simplifies monitoring, but adds holdings-weight analysis and changes the company thesis to a sector-wide driver.
- The inspected account returned CFD-only configurations for reviewed ETFs. Resolve underlying eligibility and programme costs before a live ETF branch.
- In the supplied retained Monday snapshots, no preferred sector ETF passed the transferred numerical selection screen. This is not proof that no historical market opportunities existed.

Fixed XLC and XLU comparison	Result on whole book
2025 price-only; 20% exposure; before costs	+2.02%
Same 2025 comparison; 10 bp round trip	-0.89%
Same 2025 comparison; 30 bp round trip	-6.47%
2026 bid/ask proxies; 21 matched nights; before fees	-0.04%
Same 2026 proxies; modeled 30 bp round-trip fees	-1.29%

These unconditioned price diagnostics are not a flow-plus-research backtest or audited total returns. Distributions, some CFD adjustments, FX and actual fills are unavailable. Entry-minute proxies did not establish an optimal time.

Prospective evaluation plan

Freeze rules before outcomes. Compare daily flow plus research/TA, flow-only with the same TA and operational gates, the tested weekly design and exposure-matched SPY on the same nights. Report whole-book net P&L, costs, drawdown, worst night, cash nights, execution shortfall and unresolved positions. Count independent nights/weeks; correlated stocks on one night are not independent trials.

Meeting checklist and operating decisions

Opening statement

I intend to run a small overnight underlying-stock book. Each morning I use the previous session's flow, Hidden Angles, research and technical analysis to form a fresh shortlist. I buy only qualifying names near Tuesday-through-Thursday US closes and exit at the following regular opening. I propose a \$5,000 pilot with up to three 10% positions. I have a runnable weekly paper system and want to validate the daily variant and its actual costs before enabling live execution.

Bring to the first session

- This meeting pack and the confirmed calendar invitation or Hub joining link.
- The runnable evaluation repository, its installation instructions and a working demonstration.
- The latest flow, Hidden Angles and research snapshots, with dates, receipt times and saved source identities.
- Access to the chosen agent environment and the separate downloaded bot instructions.
- The capital/risk proposal and a list of programme and broker questions below.

Questions for the programme

- Which fees are covered for this account and these underlying shares, on both opening and closing? What FX or other charges remain?
- Is the proposed \$5,000 pilot practical? Which account risk-score, loss and drawdown limits apply to the track and existing portfolio?
- Is daily selection acceptable for the evaluation plan, and which minimum forward evidence and reporting fields are required?
- Which agent environment, broker integration and autonomy level are permitted? Which actions require transaction-by-transaction confirmation?
- Can the exact underlying positions be reliably closed at the regular opening through the chosen interface? What order types and fill/status evidence are available?
- Who owns failed exits, restart recovery, alert response and permission revocation? What are the escalation and oversight expectations?

Conditions before any live entry

- Approve account, capital, loss/drawdown limits, ownership boundaries and permitted actions in an operating mandate.
- Validate the daily-selection/TA process prospectively; verify actual transaction costs and avoid rewriting rules after seeing results.
- Test the complete entry-to-exit lifecycle in an explicitly configured paper or demo environment, including missing files, partial fills, unknown acknowledgements and restart recovery.
- Confirm a working scheduled exit and mandatory approval path before each entry. Missing new research does not cancel the obligation to close an existing strategy position.

If an exit fails, reconcile the remaining owned quantity, stop new entries and notify the nominated owner. Never mark the book flat from an acknowledgement alone. Maintain an auditable record of actual fills, fees and exceptions. [3]

Source records and final change note

Meeting and preparation sources

- Acceptance message: Active Trading Track admission, four Thursday dates, 90-minute sessions, programme coverage and four preparation requirements.
- [ProInvestor Hub Active Trading Track](#): authoritative location for invitations, joining links, session-specific preparation and speaker details.

Research and validation records

- 7 October research paper, meeting brief, validation report and runnable evaluation repository: weekly paper implementation and recorded test evidence.
- 7 October ETF thesis review, source audit and simulations: separately labeled workflow and cost diagnostics.
- 7 October daily operating instructions, with daily shortlist confirmed on 8 October: current intended daily research, TA, entry and exit settings. Bot instructions are supplied separately.

Official references

[1] [NYSE holidays and trading hours](#) - regular sessions, holiday closures and early closes.

[2] [eToro fees](#) - verify the actual account and product charges and any programme entitlement.

[3] [eToro API market order guide](#) - opening and closing order workflow. Integration permissions and fill behavior must be verified.

Official references checked on 8 October 2026. Broker observations and test results above retain their 7 October dates; they are not fresh quotes or newly executed tests.

Changes from Rev 11

- The main intended selection changes from the mechanical momentum/persistence roster and removal-only overlay to a fresh daily evidence-led shortlist using flow, company research and TA.
- The long-DTE five-session overlay is replaced by an explicit 2-10-day selection hypothesis, at least \$1 million net inferred bullish premium and 70% qualifying bullish share. These are untuned starting rules.
- Initial exposure falls from ten slots and full modeled deployment to at most three 10% positions and 30% gross exposure. The \$5,000 pilot and account risk 3-4 proposal remain subject to agreement.
- Tuesday-Thursday close entries and next regular-opening exits are explicit. No planned Friday entry, weekend or full-holiday hold is included.
- The process adds source receipt records, contrary evidence, event timing, expiry checks, technical interpretation, exact position ownership and persistent fill/restart accounting.
- Historical research is preserved as comparison evidence. The weekly paper implementation is tested; the selected daily variant still needs its own validation and does not inherit historical profitability.
